Reading Assignment

Name: _____謝芷瑜_____

Date: _____Oct.8_____

Part A. Before You Read

I chose Version ___A__ because:

V I can understand the main idea.

▢ I understand most sentences.

▢ There are some new words, but I can still continue reading.

▢ I do not need to translate every sentence.

Part B. While You Read

Highlight the text with the marks:

Mark	What it means	Requirement
___	Important information	At least one in each paragraph
○	New or useful word/phrase	At least five
?	Something you do not fully understand	At least one

Part C. Vocabulary

Use the Robot to help you:

https://chatgpt.com/g/g-68b04ddfde308191846104d9de857280-vocab-dictionary

Word	Definition	Collocations (at least three)
carry out	執行、實行 (某項工作或計畫)	Carry out a plan、carry out research、 carry out an experiment
functionality	功能、功能性	Software functionality、 basic functionality、 advanced functionality
conventional	傳統的、慣例的	conventional method、 conventional technology、 conventional approach
predetermined	預先決定的、預先設定的	predetermined function、 predetermined outcome、 predetermined rules
end up	最後成為、結果變成	end up doing、end up with、 end up being

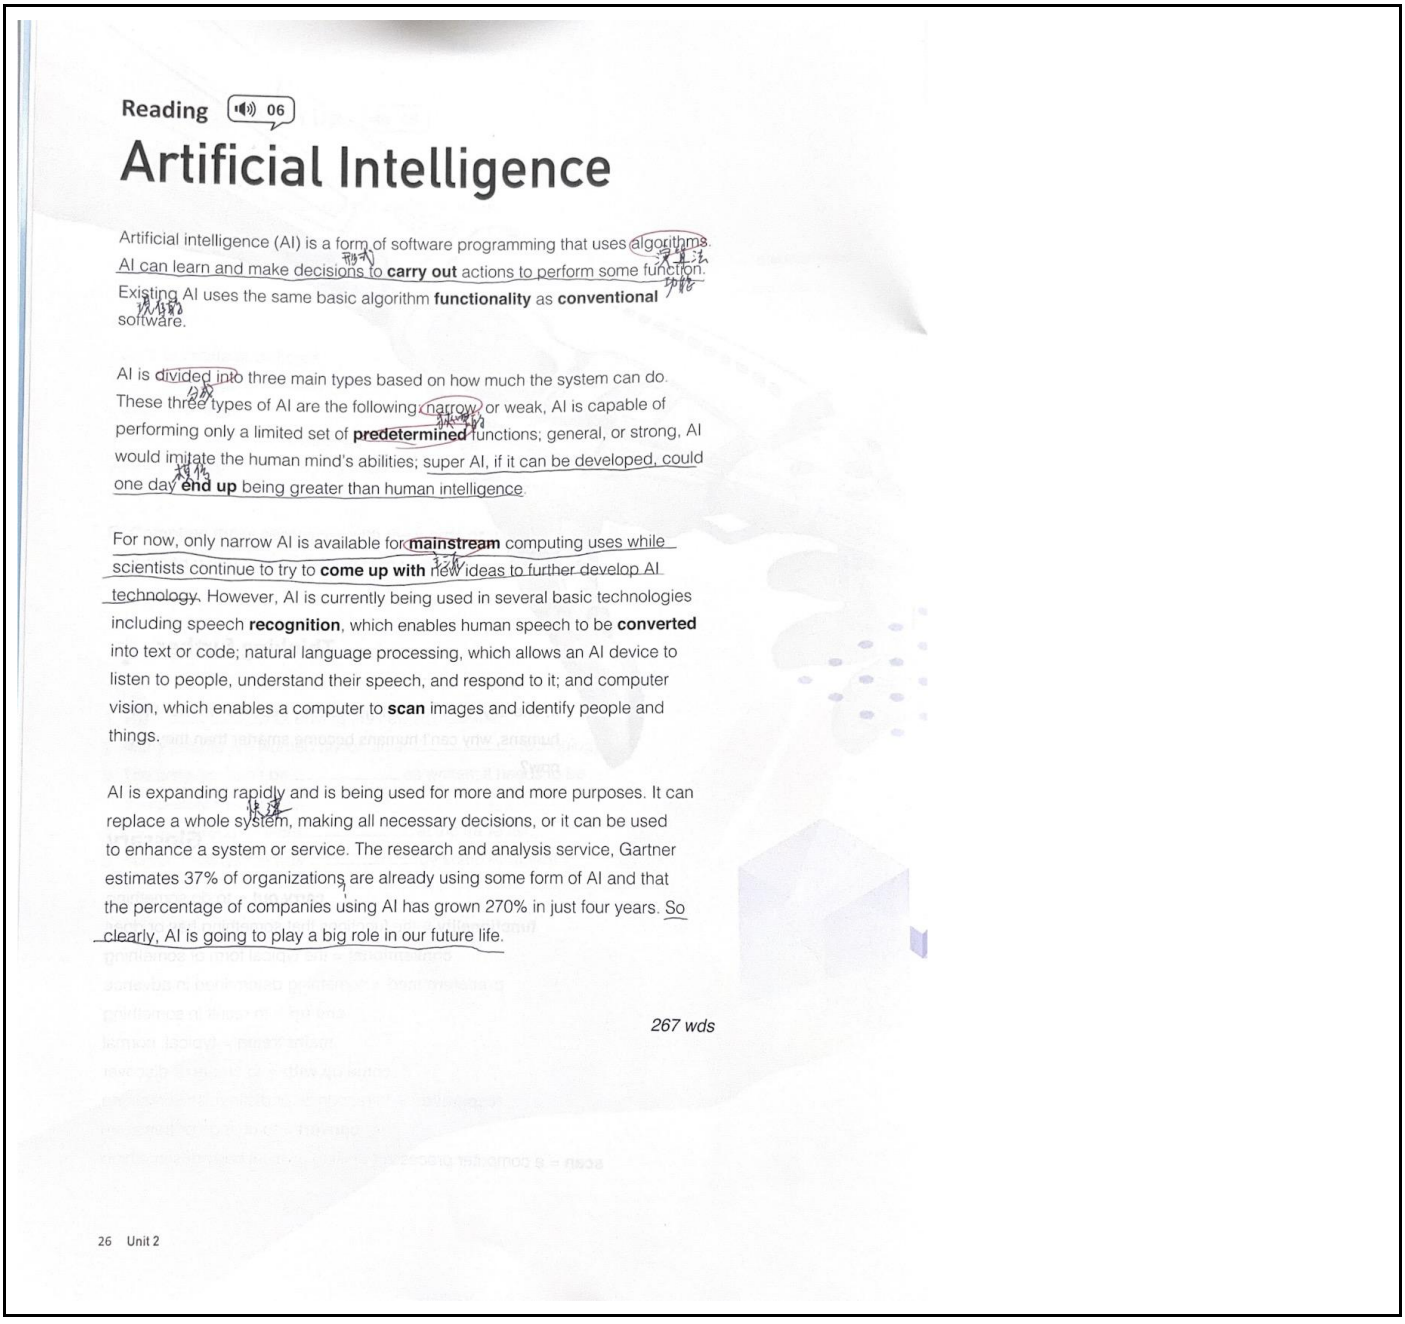

Part D. Main Idea

Write down what you think the reading means in YOUR language.

這篇文章主要在介紹人工智慧的種類、功能與發展。AI 可以執行不同任務，目前主要是較單一功能的 AI，並廣泛應用在語音辨識、語言處理及影像辨識等方面。隨著 AI 快速發展，未來將在人類生活中扮演更重要的角色。

Part E. Textbook Notes.

Scan your book with your marks and paste it here.

Reading 06

Artificial Intelligence

Artificial intelligence (AI) is a form of software programming that uses algorithms. AI can learn and make decisions to **carry out** actions to perform some function. Existing AI uses the same basic algorithm **functionality** as **conventional** software.

AI is divided into three main types based on how much the system can do. These three types of AI are the following: narrow, or weak, AI is capable of performing only a limited set of **predetermined** functions; general, or strong, AI would imitate the human mind's abilities; super AI, if it can be developed, could one day **end up** being greater than human intelligence.

For now, only narrow AI is available for **mainstream** computing uses while scientists continue to try to **come up with** new ideas to further develop AI technology. However, AI is currently being used in several basic technologies including speech **recognition**, which enables human speech to be **converted** into text or code; natural language processing, which allows an AI device to listen to people, understand their speech, and respond to it; and computer vision, which enables a computer to **scan** images and identify people and things.

AI is expanding rapidly and is being used for more and more purposes. It can replace a whole system, making all necessary decisions, or it can be used to enhance a system or service. The research and analysis service, Gartner estimates 37% of organizations are already using some form of AI and that the percentage of companies using AI has grown 270% in just four years. So clearly, AI is going to play a big role in our future life.
